

PLUMBING PRACTICE NOTE

Roofing (Stormwater) Plumbing RP 06 | Sizing a roof catchment drainage system

Audience

The audience/s for this Practice Note include/s:

_		
$ \mathbf{x} $	Architacte/	Designers
\sim		Deginiera

□ Building Surveyors/ Inspectors

☐ Home Owners / Residential Tenants

	^	D: -
IXI	()W/nar	Builders
\sim		Dullucia

□ Plumbers

☐ Real estate management agents

Purpose

This Practice Note provides guidance on roof sizing and calculations for a complete roof drainage system.

The content below provides guidance on:

- The steps required when sizing a roof catchment drainage system
- Design example of a roof catchment drainage system
- Typical types of roof catchment installations
- How to calculate roof sizing

For guidance on regulatory frameworks, please refer to Plumbing Practice Note RF 01 |Regulatory Framework.

Abbreviations & Definitions

The abbreviations and definitions set out below are for guidance only. They are not intended to vary those set out in the Building Act 1993, the Plumbing Regulations 2018 or the National Construction Code.

- Act Building Act 1993
- NCC National Construction Code 2022
- Regulations –Plumbing Regulations 2018

Steps required when sizing a roof catchment drainage system

The following steps are applicable for domestic houses with eaves gutters:

- 1 Determine the Average Exceedance Probability (AEP) 5% formerly known as ARI 20 years
- 2 Calculate the total roof catchment area
- 3 Select the eaves gutter design and the slope
- 4 Determine the downpipe size
- 5 Determine the maximum catchment area per downpipe
- 6 Determine the minimum number of downpipes required
- 7 Determine the catchment area per downpipe
- 8 Determine the most advantageous downpipe positions
- 9 Select an overflow provision
- 10 Apply to the roof catchment drainage system to the building plan

Example design of a roof catchment drainage system

The following example is a typical single storey dwelling built in Melbourne CBD with a roof pitch of 23°.

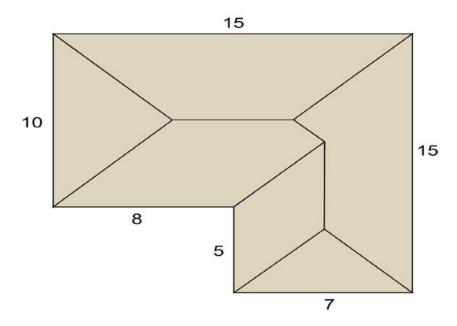

Figure 1

Design example method for sizing a roof catchment (Eaves gutters)

STEP 1:

Determine the Rainfall Intensity for the location and Average Recurrence Interval (ARI) [AEP 5%] for 20 years and a duration of 5 minutes

As per the requirements of AS/NZS 3500.3 Table D.1 the 5min/20-year ARI for Melbourne city is 132 mm/h.

STEP 2:

Calculate roof area from the plan. To calculate the total roof area, refer to AS/NZS 3500.3 Table 3.4.3.2: Catchment Slope Factor Area Multiplier.

Scenario: The roof dimensions are $(15m \times 10m) + (5m \times 7m) \cdot 150m2 + 35m2 = 185m2$.

- The roof has a 23° pitch.
- The slope factor (F) = 1.21
- F x roof plan area = 1.21m2 x 185m2
- The total roof catchment area= 223.85m2

TABLE 3.4.3.2

CATCHMENT AREA MULTIPLIER (F) FOR VARIOUS ROOF SLOPES (FOR EAVES GUTTERS ONLY)

Roof slope degrees	Multiplier (F)	Roof slope degrees	Multiplier (F)	Roof slope degrees	Multiplier (F
0	1.00	22	1.20	44	1.48
1	1.01	23	1.21	45	1.50
2	1.02	24	1.22	46	1.52
3	1.03	25	1.23	47	1.54
4	1.03	26	1.24	48	1.56
5	1.04	27	1.25	49	1.58
6	1.05	28	1.27	50	1.60
7	1.06	29	1.28	51	1.62
8	1.07	30	1.29	52	1.64
9	1.08	31	1.30	53	1.66
10	1.09	32	1.31	54	1.69
11	1.10	33	1.32	55	1.71
12	1.11	34	1.34	56	1.74
13	1.12	35	1.35	57	1.77
14	1.12	36	1.36	58	1.80
15	1.13	37	1.38	59	1.83
16	1.14	38	1.39	60	1.87
17	1.15	39	1.40	61	1.90
18	1.16	40	1.42	62	1.94
19	1.17	41	1.43	63	1.98
20	1.18	42	1.45	64	2.03
21	1.19	43	1.47	65	2.07

Table 1: Catchment area multiplier (F) for various roof slopes, referenced from 3500.3 Table 3.4.3.2 Reproduced with permission of Standards Australia Limited. Copyright in 3500.3 vests in Standards Australia Limited and Standards New Zealand.

STEP 3:

Select eaves gutters and slope. Refer to the manufacturer's guidelines for the effective cross-sectional area of the eaves gutter.

Scenario: The gutter selected has a cross-sectional area of 6125 mm2 and will be installed with a slope of 1 in 500

STEP 4:

Determine downpipe size. To determine the downpipe size, refer to AS/NZS 3500.3 Table 3.5.2.

- Round up the cross-sectional area to 6400mm2, as per Table 3.5.2.
- The minimum size of the downpipes is 100mm x 50mm or 90mm round

STEP 5:

Determine the maximum roof catchment area per downpipe

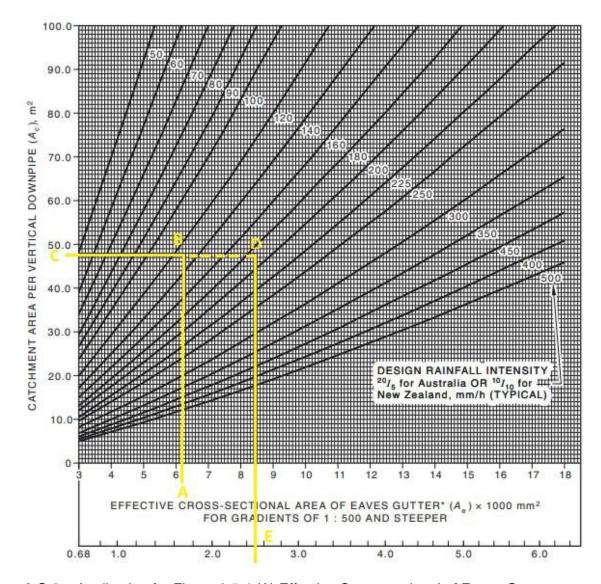

Figure 2 G.2 – Application for Figure 3.5.4 (A) Effective Cross-sectional of Eaves Gutters Reproduced with permission of Standards Australia Limited. Copyright in 3500.3 vests in Standards Australia Limited and Standards New Zealand.

Graph Interpretation:

- A. A cross-section of gutter = 6125mm2
- B. Average Rainfall Intensity (ARI) = 132 mm/h (20 year/5 mins)
- C. Catchment area per downpipe = 47m2
- D. Eaves overflow Average Rainfall Intensity (ARI) = 187mm/h (100 year/5mins)
- E. Litres per second per metre = 2.5 L/s
- = Maximum roof area per downpipe is 47m2

STEP 6:

Determine the minimum number of downpipes

To determine the minimum number of downpipes required, refer to AS/NZS 3500.3 Figure 3.5.4(a)

The minimum number of downpipes is equal to the roof catchment area divided by allowable maximum catchment per downpipe=

Calculation = $224 \div 47 = 4.75$

Round up to 5 downpipes

STEP 7:

Determine the average catchment per downpipe

Calculation: $224 \div 5 = 44m2$

STEP 8:

Divide the roof up evenly to locate downpipe positions

Note: all catchment areas are less than the maximum area per downpipe of 47m2.

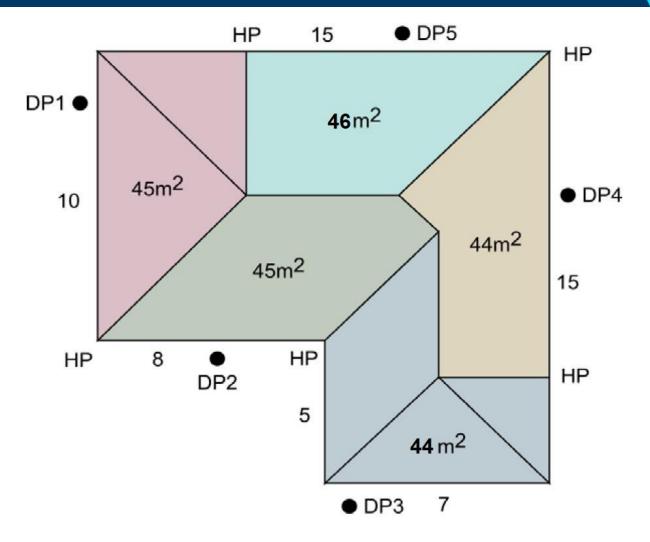

Figure 2
Reproduced with permission of Standards Australia Limited. Copyright in 3500.3 vests in Standards Australia Limited and Standards New Zealand

Legend

HP = High Point DP = Downpipe

There are many possibilities for downpipe positions. In some cases, depending on roof shape or building layout extra downpipes may be needed as it is not always possible to achieve approximately equal catchment areas.

- Valley gutters may be at high points to allow drainage away from internal angles.
- The sub catchment areas may not add up exactly due to rounding off during calculations.
- In this example, as per Step 5, no catchment area should exceed the allowable 47m2.

STEP 9:

Provide an overflow.

Note* If a gutter can overflow into the building, an overflow provision must be installed. There are different methods that can be used to provide overflow provision.

Overflow measures for eaves need to be sized to allow for a rainfall intensity for an ARI of 100 years for a 5-minute duration

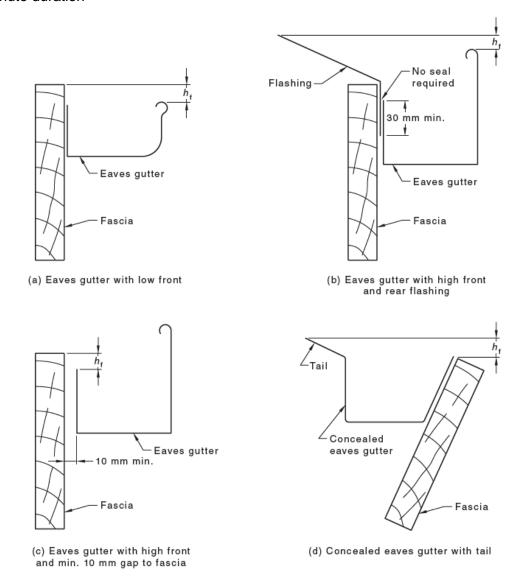

Figure 4: Overflow measures, referenced from AS/NZS 3500 Part 3
Reproduced with permission of Standards Australia Limited. Copyright in AS/NZS 3500.3 vests in Standards Australia Limited and Standards New Zealand.

To calculate Hf, please refer to AS/NZS 3500.3 Figure 3.5.4(a) Point E

Point E provides a L/s for the eaves gutter

Scenario: the eaves gutter has a cross sectional area of 6125mm2 (approximately 2.5 L/s)

Calculation: Divide 2.5 by the length of the gutter. A 10m length of 2.5 divided by 10m = 0.25 L/s per metre of gutter. Refer to Table F1 for a sloping gutter with 0.25 L/s/m the Hf is 14mm

Gutter slope	Average inflow per metre of gutter L/s/m				
	0.2	0.4	0.6	0.8	1.0
Level gutter	18	20	22	23	25
Sloping gutter	12	14	16	17	19
Minimum h _f mm					

Table 1 above : Average inflow per metre of gutter, referenced from AS/NZS 3500: Part 3: Minimum hf Values Reproduced with permission of Standards Australia Limited. Copyright in AS/NZS 3500.3 vests in Standards Australia Limited and Standards New Zealand.

The performance requirements of the NCC can also be met by a performance solution. Refer to these requirements to develop a performance solution.
